

Abstract of the Disclosure

A golf club putter and method of putting which complies with the rules of golf provides the player with an improved view of the ball and head of the putter when putting putts of a short distance. The method provides a putting stroke which aids the golfer in carrying out a putting stroke, maintains the putting face of the putter in a perpendicular orientation which respect to the line-of-putt thereby compensating for the golfer's tendency to deviate the putter face from the perpendicular orientation with respect to the line-of-putt. The steps of the method include addressing standing on an opposing side of a golf hole from the golf ball resting a surface of the green, straddling an extending line of the putt extending from the golf ball through the golf hole, extending a golf putter from the opposing side of the golf hole and positioning the putter head of the golf putter behind the golf ball with respect to the golf hole, resting the putter head of the golf putter on the surface of the green behind the ball and drawing the putter head of the golf putter toward the golf hole thereby striking the golf ball on a side of the golf ball opposing the golf hole such that the golf ball travels towards the hole.
